

## TERMINALS

Minimalisation is not automatically a guarantee of functionality and good form, - but it can be! Especially then, if the function instructions are themselves minimalist: LOOK + READ.

The classic lectern shape offers all the features required, even in the digital world. It is ergonomically advantageous, minimises reflections and is casually optimised for users of all shapes and sizes.

Form follows Function, Display devices without any fanciness, reduced to that which is essential, fulfill important information tasks at many places, both internally and externally. As single terminals (i.e. games, general information, Internet) or in an interactive combination with an exhibition object (i.e. Interactive Terrain Models), the QUOMODO-Terminals can be utilised at very differing locations.

Generally, the devices are fitted with a touch sensitive flat screen (touch screen). It combines the functions LOOK + INTERACTION. Usually,

more is not necessary. All further technology is hidden away from the user, located in the terminal console stand. Thus, attention can be focused solely to the large sized and ergonomically placed information source. The fact that an optically pleasing and suitable software with suitable contents is of no consequence.

Internet terminals infringe on the above-celebrated minimalisation due to the fact of the usual requirement of extended interaction possibilities insofar as other control elements such as a mouse or keyboard must be used, depending on the conditions prevalent in the public area, which makes the hair of most system administrators stand on end. Hacking and vandalism are the spectres that cause most fear. However, as far as QUOMODO Terminals are concerned, they cannot be impressed so easily in this sense. Both constructively as well as for the software, the bulkheads remain tight against unauthorised access.
